GAMA alumínium

VÝROBNÉ TECHNOLOGIE PRODUCTION TECHNOLOGIES

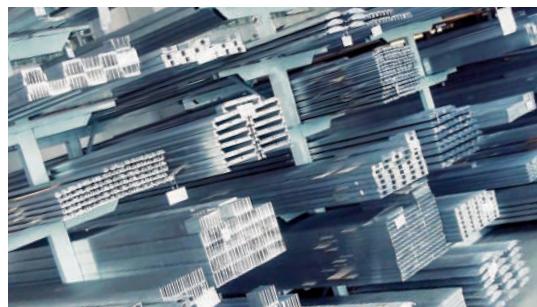

Kompletná zákazka od pílenia až po povrchovú úpravu...

Naša spoločnosť ponúka komplexné možnosti opracovania s použitím moderných strojních zariadení, automatických píl, CNC obrábacích centier až po zariadenia na anodickú oxidáciu hliníka (eloxovanie). To znamená, že vám vieme sprostredkovať kompletnú zákazku od návrhu produktu, výrobu až po povrchovú úpravu.

AL profily na sklage

GAMAalumínium disponuje s viac ako stovkou svojich vlastných profilov. V ponuke nájdete široký sortiment chladičov od slovenských, ale aj zahraničných dodávateľov.

CNC opracovanie

CNC opracovanie je najvhodnejší spôsob ako s presnosťou opracovať hliníkové chladiče podľa vašich požiadaviek. Našich 10 CNC obrábacích centier v prevádzke dokáže zabezpečiť výrobu vašej zákazky včas a v požadovanej kvalite.

Pílenie hliníkových profilov

Pílenie, ako najjednoduchšiu a zároveň najčastejšiu požiadavku na výrobu, zabezpečujú na našom pracovisku automatické a poloautomatické kotúčové píly. Ponúkame pílenie profilov zo štandardných dĺžok 2, 4 a 6m priamo z nášho skladu na dĺžky a množstvá, aké potrebujete.

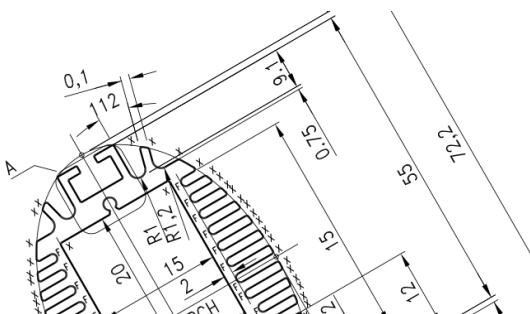

Zváranie profilov trením

Nové technológie spájania materiálov pomocou CNC zariadení nám umožňujú spájanie hliníkových zliatin pomocou trenia a vďaka tomu sme schopní vyhotoviť nadzerné chladiče vysokej kvality.

Eloxovanie a titanovanie

Po aplikácii vhodnej povrchovej úpravy splňa eloxovanie okrem funkčných aj estetické požiadavky na povrch výrobku. Realizujeme povrchovú úpravu v odtieňoch prírodná, čierna a modrá.

3D meracie pracovisko

Naša spoločnosť disponuje súradnicovým meracím zariadením od spoločnosti Hexagon, vďaka ktorému sme schopní rozšíriť možnosti opracovania na CNC obrábacích centrach a tak pokračovať v neustálom zlepšovaní kvality našich výrobkov.

Zákaznícke profily

Nenašli ste vhodný profil? Dokážeme vám sprostredkovať vlastný profil presne podľa vašich požiadaviek, prípadne v spolupráci s našimi konštruktérmi. O výrobu, opracovanie a dodanie sa postará GAMAlumínium.

Pozrite si našu videoprezentáciu.

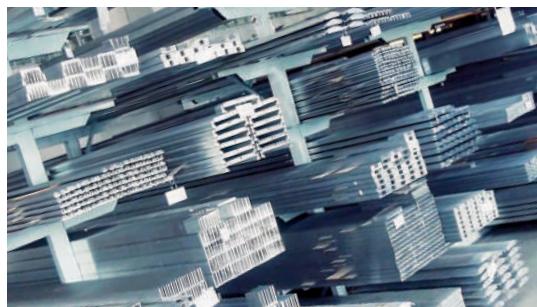

A complete order from sawing to surface treatment...

Our company offers complex options of machining using advanced machinery, sawing machines, CNC machining centers and equipment for anodic oxidation (anodizing). That means, we are able to produce a complete order from the product design and its production to surface treatment.

AL-profiles in stock

GAMAalumínium has got more than a hundred of its own profiles and offers a wide range of heatsinks from Slovak and foreign suppliers as well.

AL-profiles sawing

Sawing as the simplest and most frequent production requirement can be provided by the automatic or semi-automatic circular saws. We offer profile sawing from standard length 2, 4 and 6 m in required lengths and quantity, directly from our stock.

CNC machining

CNC machining represents the best way how to machine the aluminium heatsinks according to your requirements. Our 10 CNC machining centers are able to satisfy all orders in time and in required quality.

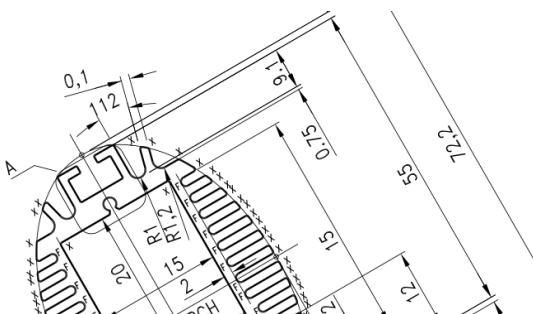

CNC FSW welding

The new technologies allow us to join the aluminium alloys by friction (FSW), so we are able to produce oversized heatsinks of high quality.

Anodizing

Along with functional effect, these treatments meet also esthetical requirements after application of suitable surface treatment. We offer natural, black, and blue color.

3D measuring workplace

Our company uses a coordinate measuring machine from Hexagon, so we are able to improve the quality of our products thanks to the expansion of the processing capabilities of our CNC machining centres.

Customer's profiles

Have you not found the required profile? We can provide your own profile according to your requirements or in cooperation with our constructors. Our company will take care of the production, machining and delivery to you.

Play corporate presentation.

Všeobecný popis

General description

Hliníkové chladiče

sa vyrábajú z lisovaných profilov, ktoré nakupujeme od rôznych domáčich a zahraničných výrobcov. Profily nakupujeme a skladujeme v dĺžkach 2000 - 4000 mm.

Niekteré typy chladičov v aktuálnej ponuke sa môžu mierne líšiť od profilu uvedeného v katalógu, jedná sa hlavne o tvar rebier (môžu byť rovné alebo mierne zvlnené), hrúbku rebier a pod. Túto skutočnosť so zákazníkom konzultujeme pred dodávkou.

Obvod uvedený pri uzavretých profiloch je špecifikovaný ako vonkajší.

Špecifická hmotnosť hliníka je 2,7 kg/dm³.

Všetky dodávané profily sú v súlade so smernicou RoHS.

Normy

Hliníkové profily sú lisované podľa nariem EN 755-5 až 9. Tieto normy hovoria o prípustných odchýlках skutočných profilov od menovitých hodnôt.

Materiál použitý na chladiče je AW6060 (Al Mg 0,5Si), príp. AW6063 (Al Mg 0,7Si), ktorých chemické zloženie zodpovedá hodnotám stanoveným v norme EN 573-3.

Povrch profilov je podľa normy EN 755-1.

Pri opracovaní, pokiaľ nie sú vo výkresovej dokumentácii uvedené tolerancie a požiadavky, sa riadime všeobecnými toleranciami STN ISO 2768-1 triedy m, ktoré sa týkajú dĺžok, uhlov, rovinnosti, zrazení hrán, povrchu a pod.

Ponúkame...

Profily dodávame napílené na požadované dĺžky, prípadne opracované na CNC strojoch podľa dodanej výkresovej dokumentácie. Chladiče v prípade požiadavky zvárame trením (FSW) a ponúkame aj povrchovú úpravu eloxovaním alebo titanovaním.

V prípade, že si z našej ponuky nevyberiete žiadny chladič, vieme zabezpečiť výrobu nového profilu podľa vašej požiadavky, alebo zabezpečiť profil od iných dodávateľov.

Aluminium Heatsinks

are being manufactured from pressed profiles, which we buy from various domestic and foreign producers. We buy and store the profiles in lengths 2000 - 4000 mm.

Some types of heatsinks in the current offer may be slightly different from the profile specified in the catalogue, mostly the shape of the ribs (may be straight or slightly wavy), the thickness of the ribs, etc. We consult this fact with the customer before the delivery.

The perimeter mentioned with closed profiles is specified as outer perimeter.

The specific weight of aluminium is 2,7 kg/dm³.

All profiles supplied by GAMAlumínium are in accordance with the RoHS Directive.

Standards

AL profiles are pressed according to the standard EN755-5 to 9. These standards speak about the tolerance of the actual profiles from the nominal values.

The material used for heatsinks is AW6060 (Al Mg 0,5 Si) or AW6063 (Al Mg 0,7 Si) and their chemical composition corresponds to the values assessed by the standard EN 573-3.

The surface of the profiles is according to the standard EN 755-1.

If the tolerance and other requirements are not mentioned in the drawing documentation, we follow the general tolerances of STN ISO 2768 – 1, class m, concerning the lengths, angles, flatness, deducting the edge, surface etc.

We offer...

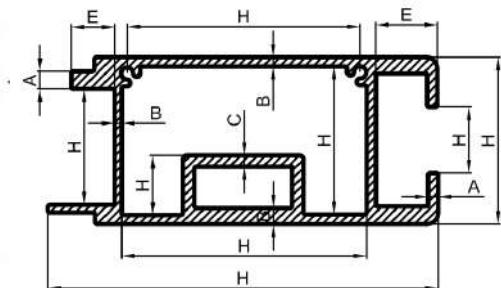

The profiles to be delivered are cut in required lengths and machined on CNC centers according to the drawing documentation provided. We offer friction stir welding (FSW), anodizing or titan, if requested.

In case you have not found any suitable heatsink from our offer, we can provide it from another supplier or we will arrange the production of a new profile according to your requirements.

Meranie tepelného odporu chladičov

(R_{th})

Tepelný odpor chladičov elektronických súčiastok je dôležitý údaj pre konštruktérov elektronických zariadení, ktorý umožňuje optimálne navrhnuť odvod stratového tepla súčiastky pri dodržaní jej maximálnej dovolenej pracovnej teploty a to pri minimalizácii rozmerov chladiča. Pri jednoduchších geometrických tvaroch je možné stanoviť tepelný odpor chladiča s dosťatočnou presnosťou aj výpočtom, no pre komplexnejšie tvary so zložitým obtekáním vzduchu okolo chladiča je často potrebné uskutočniť meranie tepelného odporu.

Definícia tepelného odporu

Tepelný odpor chladiča R_{th} je definovaný ako podiel rozdielu maximálnej teploty chladiča T_{ch} a teploty okolitého vzduchu T_v k tepelnému výkonu P rozptyľovaného chladičom do okolia v rovnovážnom stave:

$$R_{th} = \frac{T_{ch} - T_v}{P}$$

Rovnovážny stav, je stav, kedy dodávaný výkon do chladiča je rovný tepelnému výkonu rozptyľovaného chladičom do okolia. Z toho tiež vyplýva, že pri konštantnej teplote okolitého vzduchu sa teplota chladiča v rovnovážnom stave nemení. Ak tepelný výkon dodávaný chladiču je generovaný ako Joule-Lenzovo teplo vznikajúce ako tepelná strata na odpore R výhrevného telesa, ktorým preteká jednosmerný prúd I a vzniká na ňom úbytok napäcia U , potom tepelný výkon dodávaný chladiču je rovný elektrickému výkonu dodávaného do výhrevného telesa:

$$P = U \cdot I$$

Metóda merania

Do chladiča je pomocou elektrického výhrevného telesa počínajúc časom t_0 , dodávaný zvolený elektrický výkon, ktorý je so 100% účinnosťou transformovaný ako Joule-Lenzovo teplo na tepelný výkon. Teplota chladiča postupne narastá až dosiahne plató, ktoré signalizuje dosiahnutie rovnovážneho stavu.

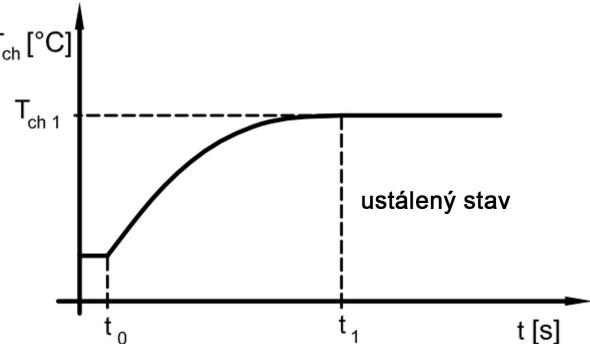

Za tohto stavu je dodávaný elektrický výkon do výhrevného telesa rovný tepelnému výkonu, ktorý je rozptyľovaný chladičom do okolia. Za ustáleného stavu sú odmerané všetky veličiny potrebné pre výpočet tepelného odporu a následne je tepelný odpor chladiča vypočítaný podľa vzorca:

$$R_{th} = \frac{T_{ch} - T_v}{U \cdot I}$$

Pre jednoduchosť sa často v katalógoch s chladičmi udáva len jedna hodnota tepelného odporu R_{th} , zmeraná pri takom stratovom výkone, pri ktorom teplota chladiča za danej teploty okolitého vzduchu 20 °C dosiahne zvolenú hodnotu. Ak je chladič určený na chladenie bežných elektronických súčiastok, zvolenou hodnotou teploty býva najčastejšie teplota 75 °C.

Podmienky merania

- teplota chladiča 75 °C
- teplota okolitého vzduchu v rozsahu 20 až 22 °C
- tlak vzduchu v rozsahu 980 až 1020 hPa
- relatívna vlhkosť vzduchu 20 až 80 %
- normálne zloženie vzduchu (D 78%, O 21%, Ar 0,9%, CO₂ 0,03%)
- meranie R_{th} bolo uskutočnené bez umelej akcelerácie prúdenia vzduchu v okolí chladiča
- teplota vzduchu bola meraná vo vzdialosti 50 mm pod spodným okrajom chladiča
- pri meraní tepelného odporu boli chladiče umiestnené tak aby bolo zabezpečené maximálne samovolné prúdenie zohriateho vzduchu

Grafické znázornenie priebehu nárastu teploty chladiča v čase

Namerané výsledky tepelného odporu sú platné za spomenutých podmienok merania !!!
Tepelné odopy uvádzané v katalógu sú len informatívne.

The thermal resistance measurement of heatsinks

(R_{th})

The heatsinks thermal resistance of electronic parts represents an important information for electronic equipment constructors that allows an optimal designing of the thermal loss outlet by maintaining the maximum working temperature limit of the part and minimized heatsink dimensions. In case of simpler geometric dimensions, it is possible to determine the heatsink thermal resistance with accurate calculation but it is often required to measure thermal resistance in case of more complex shapes with complicated air flow around the heatsink.

Definition of thermal resistance

Thermal resistance of heatsink R_{th} is defined as a proportion of difference of maximum heatsink temperature T_{ch} and ambient temperature T_v to thermal output P dispersed by the heatsink to surrounding area in the state of equilibrium:

$$R_{th} = \frac{T_{ch} - T_v}{P}$$

The state of equilibrium is a condition when power input in the heatsink equals to thermal output dispersed by the heatsink in surrounding area. Accordingly, heatsink temperature in the equilibrium status doesn't change at constant ambient temperature. If thermal output supplied to the heatsink is generated as the Joule-Lenz heat generated as a thermal loss of heating body resistance R that DC current passes through, the voltage (U) drops thereon, then thermal output supplied to the heatsink equals to electric output supplied to the heating body:

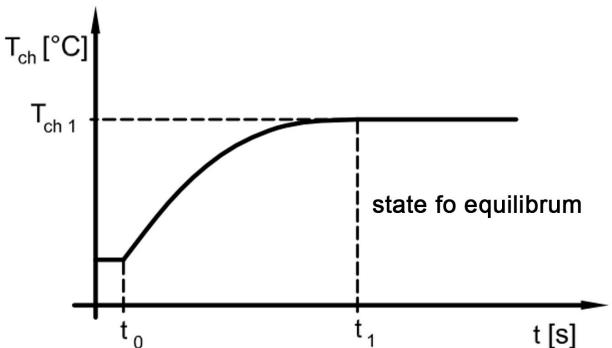

$$P = U \cdot I$$

The measurement method

The selected electric output is supplied to the heatsink beginning at the time t_0 , that is transformed as a Joule-Lenz heat to thermal output with 100% efficiency. The heatsink temperature gradually increases up to the level that signalizes reached equilibrium status..

In this condition, electric output supplied to heating body equals thermal output dispersed by the heatsink to the surrounding area. All parameters required to calculation of thermal resistance are measured at the status of equilibrium and subsequently, the heatsink thermal resistance is calculated according to the following formula:

$$R_{th} = \frac{T_{ch} - T_v}{U \cdot I}$$

To simplify, there is often only one value of the thermal resistance R_{th} specification in catalogues, measured at such output loss when the heatsink temperature at ambient temperature 20 °C reaches the selected value. If a heatsink is intended to cool down common electronic parts, chosen temperature usually refers to 75 °C.

Measurement terms

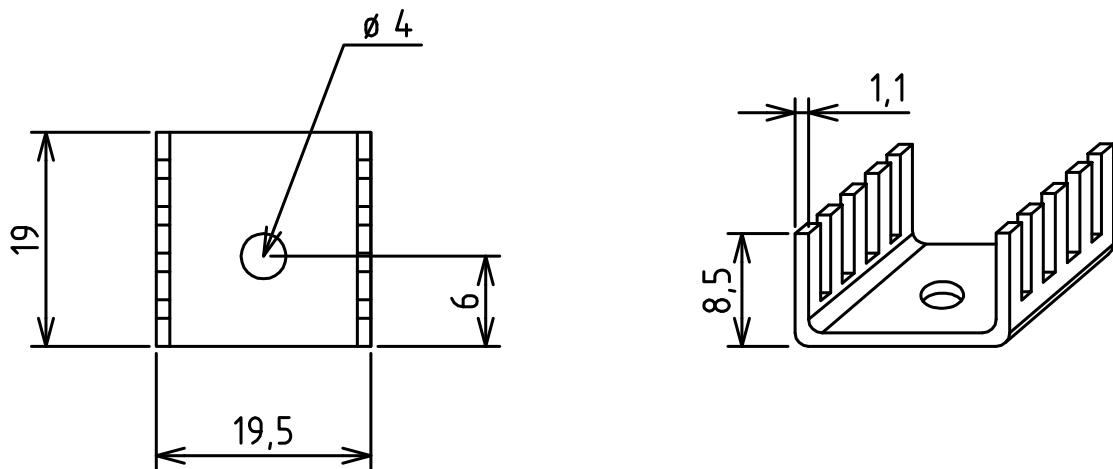

- Heatsink temperature 75 °C
- Surrounding temperature within 20 - 22 °C
- Air pressure within 980 - 1020 hPa
- Relative air humidity within 20 - 80 %
- Standard air composition (D 78%, O 21%, Ar 0,9%, CO₂ 0,03%),
- Measurement of R_{th} was conducted without artificial air flow acceleration around the heatsink
- Air temperature was measured at distance 50 mm under the bottom heatsink edge
- During thermal resistance measurement, the heatsinks were located that way, to ensure the maximum self-flowing of heated air

All measured values of thermal resistance are valid under the above-mentioned measurement conditions.
Thermal resistance values stated in the catalogue are only for information purposes.
